Work sample: developer.alianza.com

Dear Temporal Hiring Team,

Your posting says what makes agents powerful is connecting them to services and data, and asks how to prioritize capabilities like identity propagation and rate limits and how to bootstrap an ecosystem of connectors. I spent this year on those questions for a connectivity layer between AI agents and telephone networks.

At Alianza, through November 2026, I owned the developer-facing surface of Crux, the control plane through which AI agents get governed access to live phone calls on more than a thousand operators' networks: the public API, events and webhooks, and developer.alianza.com. Identity, policy, and consent are applied in the network before an agent acts on a call. I built the portal, including the authentication guide and the platform guarantees partners build against, and I built the MCP server prototype for the API so coding agents could discover and call it. I reviewed, critiqued, and proposed APIs, keeping Architecture in the loop, and jointly set the standards engineering teams built against so that each new experience provider connected without bespoke work on our side. The 1.0 launch in September shipped with experience providers already integrating in sandbox.

Before Alianza, the work was SDKs and identity. At Vonage I owned client SDKs across eight operating systems for a video API platform used by first-party apps, direct API customers, and third-party developers, and led it through 10x growth. At Vonage and Ericsson I led Enhanced Number Verification, extending a commercial CAMARA identity API past its limits with mobile operators and handset manufacturers, and built network APIs with Ericsson for hundreds of operators. At VoiceBase I shipped the v3 API and SDKs that cut support tickets 40%.

I have not worked on a durable-execution or workflow-orchestration product. The closest I have come is the delivery and recovery semantics partners build against on Crux: at-least-once webhooks and the runbooks for recovering when a partner's state drifts from ours. I know what I would need to learn, and I have ramped into new domains before: Crux, network APIs at Charter, and the Ericsson platform were each new when I started. I work directly with code when it is the fastest way to validate an integration, and I build with Claude Code daily.

I am available now and would welcome a conversation about which part of Nexus you would want first.
