Dear 1Password Hiring Team,

The posting describes a portfolio about how developers and AI-powered systems securely interact with 1Password, from local development to programmatic agent access. I have spent 2026 on the telephone-network version of that problem, and I would like to bring what I learned to the credential side of it.

At Alianza I own the developer experience for Crux, the control plane through which AI agents get governed access to live phone calls and voice data on more than a thousand operators' networks. Crux sits in the call path: it applies identity and policy before any AI is invoked, plays and logs consent in the network, then hands the call to the agent. The platform and its access model were designed before I joined. What I built is how developers reach it. developer.alianza.com launched in September 2026 with every page generated by AI agents and reviewed by humans, from a documentation system I designed that produces reference docs from the API definition and says plainly where the definition leaves a gap rather than guessing. I built an MCP server for the API so coding agents can work against the platform directly. I helped guide the structure of the Crux API with Architecture, and with Architecture I set the standards engineering teams build against and review their proposals. One surface serves third-party AI experience providers, the operators whose networks carry the calls, and our own provisioning systems, and each new provider integrates without bespoke work.

Identity, access, and standards run through the rest of my record. At Vonage and Ericsson I led Enhanced Number Verification, a CAMARA identity API that was already commercial but limited; I led the work with mobile operators and handset manufacturers that overcame those limits, across a team spanning three companies, and presented the API strategy to European operators at Ericsson Innovation Days. At Aerohive I was the product manager for the API platform and developer ecosystem of an enterprise WiFi company, building sample apps, videos, and docs for the developer community, and co-invented two patents on credential management and device onboarding. At Vonage I owned a multi-tenant video API platform through 650% telehealth growth in six weeks and shipped Video Express from prototype to GA in under nine months.

One thing to say plainly: you ask for five or more years leading senior PMs or product portfolios. I have owned portfolios, from client SDKs across eight platforms to the full Crux developer surface. I was the first of five PMs hired into Vonage Video, onboarded and oriented the other four, set up the structures that let the team coordinate work and prioritize uniformly, and created the group's PM process, which later became a company-wide framework. I never officially managed those PMs, and I have not run a group of senior PMs with hiring and performance authority. I would rather you know that now than discover it in an interview, and I would want to talk about how the role is scoped.

Why 1Password: 1Password for Agents shipped the week this role was posted, Apono brought just-in-time access for humans, machines, and agents, and Unified Access put credentials for automated workflows under one roof. Agents need credentials the way they need phone lines: granted, scoped, revocable, with a human approving the consequential step. I am a daily Claude Code user, I operate an LLM-built documentation system in production, and I have written publicly about where these systems should and should not be trusted. That judgment is what I would bring to deciding which ways of giving agents access will last and which will not.

I would welcome a conversation about what the Developer & AI portfolio needs in its first year.
