Dear Anthropic Hiring Team,

The Safe Access role describes a product I have spent the last year on the developer-facing side of: a centralized access system that every other product depends on, used by first-party systems, direct API customers, and third parties, where the developer's first experience of it decides whether the controls get used or worked around.

At Alianza I own the developer-facing surface of Crux, the control plane through which AI experiences get access to live phone calls and voice data on more than a thousand operators' telephone networks. Crux sits in the call path. It applies identity and policy before any AI is invoked, plays and logs consent in the network, then hands the call to a virtual agent or streams the media to a post-call intelligence partner. It is an access system by construction, and the stakes are the same as yours: get it wrong and a third party hears a conversation it should not. The platform and its access model were designed before I joined. What I built is how developers get access to it: developer.alianza.com, where a partner learns the platform's resource model, runs the eligibility check, the per-account connection with its on/off gate, and assignments scoped to an account, user, or phone number, and finds the authentication guide they integrate against, with every page generated by AI agents and reviewed by humans. I helped guide the structure of the Crux API with Architecture, and with Architecture I set the standards engineering teams build to and review their proposals, which is the part of this job description about building new programs on shared primitives rather than forking them. The same surface serves third-party AI experience providers, the operators whose networks carry the calls, and Alianza's own provisioning systems. It shipped as the 1.0 developer experience in September 2026.

Identity and verification are not new ground for me. At Vonage and Ericsson I led Enhanced Number Verification. The CAMARA identity API was already a commercial product, but with limitations that kept it from the use cases operators wanted, and I led the work with mobile operators and handset manufacturers that overcame them, across a team that spanned three companies. Before that I owned Vonage's multi-tenant video platform through 650% telehealth growth in the first six weeks of the pandemic and shipped Video Express, a 0-to-1 SDK, from prototype to GA in under nine months. At Aerohive I co-invented two patents on credential management and device onboarding.

Why this role: scaling access to Claude safely sits on the critical path of every launch, and I have been the person on that path. I am a daily Claude Code user, I operate an LLM-built documentation system in production, and I have written publicly about where these systems should and should not be trusted. I would bring that same judgment to deciding how access is granted, verified, and revoked.

I would welcome a conversation about what the first six months of this product need.
