---

Dear Avaya Hiring Team,

The line in your posting I would underline is "experience helping evolve an established enterprise product toward a more open and extensible platform." I have done that three times, and the most recent one is the job I hold now.

At Alianza I own the developer-facing surface of Crux, the control plane through which AI companies get governed access to live phone calls on more than a thousand operators' networks: the public API, events and webhooks, and developer.alianza.com. The platform was designed before I joined. What I built is how developers and partners reach it. The portal launched in September 2026, every page generated by AI agents and reviewed by humans, with ten-minute quickstarts to a live call and the authentication guide partners integrate against. I built an MCP server for the API so coding agents can work against it directly. I helped guide the structure of the Crux API with Architecture, and with Architecture I set the standards engineering teams build against and review their proposals, so that separately built services converge on one set of conventions and each new partner integrates without bespoke work.

The two earlier cases: at Twilio I directed SendGrid's transition from an email API to a multi-channel communications platform, and at Aerohive I was the product manager for the API platform and developer ecosystem of an enterprise WiFi company, building sample apps, videos, and docs for the developer community and delivering capabilities that are still considered novel today. In between, I was lead PM for Vonage's video API platform, used by first-party apps, direct API customers, and third-party developers with SDKs across eight operating systems, through 10x growth; built network APIs with Ericsson for hundreds of mobile network operators; and shipped VoiceBase's v3 API, docs, and SDKs, which cut support tickets 40%. All of it is enterprise communications, which is the first item on your "particularly valuable" list.

On discovery: I practice Outcome-Driven Innovation, learned at SendGrid Labs, and now use AI agents to prepare for and synthesize customer and developer discovery interviews, which I have written about publicly. I build with AI assistance daily and can tell you where it should and should not be trusted, which matters for an AI platform's developer surface.

I would welcome a conversation about where Infinity's APIs and developer experience are today and what the first year of this role would need to change.
