Dear Wheel Hiring Team,

In the spring of 2020 I was the lead product manager for the video platform that carried telehealth visits for Teladoc and other providers through 650% telehealth growth in six weeks and 10x for the year. Patients never saw our name; they saw their provider's. That is the shape of Wheel's business, and it is the shape of most of my career: platforms where the end user, the integrating developer, and the paying customer are different parties, and the product has to serve all three at once.

I should say plainly what I am and am not. I have not owned a consumer product at a healthcare company, and my AI product work is a documentation system in production rather than a patient-facing feature. What I have done is the systems half of this role for eleven years. At Alianza I own the developer-facing surface of Crux, the control plane through which AI companies get governed access to live phone calls on more than a thousand operators' networks. Operators keep the customer relationship and offer the experiences under revenue-share, referral, or white-label models; consent, identity, and policy are applied in the network before any AI touches a call; and I own the surface the people building on it work from, including an MCP server so coding agents can work against the API directly. The standardize-versus-configure question in your posting is the one I work on daily: what stays the same for every operator and experience provider, and what has to flex.

On AI: I designed and operate the AI-built documentation system behind developer.alianza.com. Agents generate the reference and code samples from the API definition, humans review, and the system states plainly where the definition leaves a gap rather than guessing. Deciding where the system is trusted and where a person stays in the loop is the tradeoff your intake and triage work will keep making, and I have written publicly about it.

On method: I practice Outcome-Driven Innovation, learned at SendGrid Labs, and use AI agents to prepare for and synthesize customer and developer discovery interviews. When lockdown-era customers moved from 2-4 party calls to 25-100 party sessions, that discipline produced Video Express: prototype, customer interviews, beta in under three months, GA in under nine, and 10% of the platform's 2019 minutes within a year.

You are hiring a builder to set a multi-year direction and also make the week-to-week calls. I would welcome a conversation about which partner's front door to start with.
