---

Dear MongoDB Hiring Team,

The Partner Platform role describes the job I have been doing since January: a partner API where the partners are AI companies, the builders are increasingly agents, and the measure of the platform is how fast a new partner gets to a working integration without anyone on our side doing bespoke work.

At Alianza I own the developer-facing surface of Crux, the control plane through which AI companies get governed access to live phone calls on more than a thousand operators' networks. A partner integrates once and reaches every operator on the platform. The platform was designed before I joined. What I built is how partners reach it. developer.alianza.com launched in September 2026, every page is generated by AI agents and reviewed by humans, with ten-minute quickstarts to a live call and the authentication guide partners integrate against. I built an MCP server for the API so coding agents can work against it directly. I helped guide the structure of the Crux API with Architecture, and with Architecture I set the standards engineering teams build against and review their proposals.

The rest of my record is partner platforms at larger scale. Vonage's video API served first-party apps, direct API customers, and third-party developers on one multi-tenant platform, with SDKs across eight operating systems; I led it through 10x growth and took advantage of market events to do strategic take-share initiatives capturing an additional $3M in under six months. At Ericsson (which acquired Vonage), I built network APIs with a team serving hundreds of mobile network operators, and led Enhanced Number Verification with operators and handset manufacturers across three companies. At Aerohive I ran the API platform and developer ecosystem for an enterprise WiFi company, delivering capabilities that are still considered novel today. At VoiceBase I shipped the v3 API, docs, and SDKs that cut support tickets 40%.

I have not worked on a database or data-infrastructure product; the partner, agent, and API parts of this role are mine, the MongoDB-specific parts I would learn.

I use AI tools in my own work every day and have written publicly about where they should and should not be trusted. That is the judgment I would bring to making a partner platform that is understandable to people, usable by agents, and resilient under automation.
