---

Dear GitHub Hiring Team,

My GitHub profile is on my resume because it is where I work. Twenty-eight repositories, eight of them updated in the last year, including the documentation generator behind a production developer portal and an MCP server for a live API. I am applying for the Platform product role because the thing you describe, platforms and APIs that let partners, integrators, and developers build on GitHub, is what I have spent eleven years building for other companies' developers.

At Alianza I own the developer-facing surface of Crux, the control plane through which AI companies get governed access to live phone calls on more than a thousand operators' networks. The platform was designed before I joined; what I built is how developers reach it. developer.alianza.com launched in September 2026 with every page generated by AI agents and reviewed by humans, from a documentation system I designed that produces reference docs from the API definition and says plainly where the definition leaves a gap. I built an MCP server for the API so coding agents can work against it directly. I helped guide the structure of the Crux API with Architecture, and with Architecture I set the standards engineering teams build against: RFC 9457 errors with trace IDs, cursor pagination, deprecation paths, webhooks with at-least-once delivery. One surface serves third-party AI experience providers, the operators whose networks carry the calls, and our own provisioning systems, and each new provider integrates without bespoke work. That is the enterprise-grade, ecosystem-facing platform work your posting describes, at a smaller scale than yours.

Scale and ecosystems are the rest of my record. At Vonage I was lead PM for a multi-tenant video API platform used by first-party apps, direct API customers, and third-party developers, with client SDKs across eight platforms. I took it through 650% telehealth growth in six weeks and 850% for the year while it stayed reliable, shipped Video Express from prototype to GA in under nine months, and captured $3M in six months through a targeted developer migration. At Ericsson I built network APIs with a team serving hundreds of mobile network operators. At Aerohive I ran the API platform and developer ecosystem for an enterprise WiFi company. At VoiceBase I shipped the v3 API, SDKs, and developer console that brought an AI speech-to-text capability to customers and cut support tickets 40%.

On the AI qualification, said plainly: I have shipped one AI capability to customers through an API (VoiceBase), I operate an LLM-built documentation system in production, I build daily with Claude Code, and I have written publicly about where these systems should and should not be trusted. I have not shipped a consumer-scale generative AI product. I would bring the platform judgment and learn the rest fast.

Why GitHub: 180 million developers already treat it as the platform. The next layer, agents working inside repositories, MCP servers as first-class integrations, enterprise controls that let a company trust what an agent does, is exactly the governed-access problem I work on now, moved from phone networks to code. I would like to help build it.
