---

Dear GitHub Hiring Team,

My GitHub profile is on my resume because it is where I work: twenty-eight repositories, including the documentation generator behind a production developer portal and an MCP server for a live API. I am applying for the Platform role because platforms and APIs that let partners, integrators, and developers build on top of a product are what I have spent eleven years building.

At Alianza I own the developer-facing surface of Crux, the control plane through which AI companies get governed access to live phone calls on more than a thousand operators' networks. The platform was designed before I joined; what I built is how developers reach it. developer.alianza.com launched in September 2026, every page generated by AI agents and reviewed by humans. I built an MCP server for the API. I helped guide the structure of the Crux API with Architecture, and with Architecture I set the standards engineering teams build against. One surface serves AI experience providers, the operators whose networks carry the calls, and our own provisioning systems, and each new provider integrates without bespoke work.

Before that: lead PM for Vonage's multi-tenant video API platform, used by first-party apps, direct API customers, and third-party developers, with SDKs across eight platforms, through 650% growth in six weeks and 10x for the year. Built network APIs with Ericsson for hundreds of mobile network operators. Ran the API platform and developer ecosystem at Aerohive. Shipped the VoiceBase v3 API and SDKs that brought an AI speech-to-text capability to customers and cut support tickets 40%.

On the AI qualification, plainly: one AI capability shipped to customers through an API, an LLM-built documentation system in production, daily work in Claude Code, and published writing on where these systems should and should not be trusted. No consumer-scale generative AI product. I would bring the platform judgment and learn the rest fast.

Why GitHub: the next layer, agents working inside repositories, MCP servers as first-class integrations, enterprise controls that let a company trust what an agent does, is the governed-access problem I work on now, moved from phone networks to code.
